

GREEN PE

Green PE means a plastic made from renewable raw materials. It can often be hydrocarbons originating from sugar cane, pine oil or used cooking oil.

Since the material is polymerized from scratch, quality can be ensured to the same degree as for new raw materials but with a lower climate impact.

Green PE can theoretically be used for all applications as a new raw material, but access is more limited.

It is important to point out that the plastic cannot be composted, the used plastic is recycled in existing recycling flows for plastic packaging.
