

PIR

When factory waste is recycled to make new plastic products, the material is usually referred to as **PIR**, this term stands for **Post Industrial Recycled**.

The great advantage of **PIR** is that the quality, due to the careful sorting processes in the industry, stays quite close to new raw material.

The material is therefore used to a large extent in industrial packaging and other products that do not come into contact with food but which at the same time have high requirements for strength and durability.

Used plastic is recycled in existing recycling flows for plastic packaging.
